

A New 13K Distinctly Designed For Volvo Trucks

The Link® 13K for Volvo Applications is now available as a no-upcharge option.

Effective with the most recent Volvo price book update, the Link® 13K self-steer suspension has been released as a **No-Upcharge** CA suspension spec option.

The lightweight 13K from Link®, designed specifically for Volvo, incorporates improved lift spring geometry to assure longer spring life and less downtime. The engineered positioning of the lift bags reduces bushing wear and minimizes the opportunity of puncture due to road debris. And Link's patented interchangeable ride-height brackets allow flexibility for future applications.

The Link 13K comes with the same level of engineering found in the 20K non-steer axle that is the key component of the Volvo 6x2 configured within Volvo's fuel-efficient Adaptive Loading package on its XE Series. The same axle configuration that is also available on the Mack Load Logic as part of the Super Econodyne powertrain package.
